

Laser Hair Bleaching

Patient Name	:	AYAZ ALI				Emirates ID	:	784-1999-7855454-5
File No	:	7000341	DOB	:	1999-07-29	Nationality	:	Indian
Gender	:	Male	Doctor's Name	:	Doctor-9 test	Date	:	2023-11-18

Laser hair bleaching is the ultimate solution for the fine hairs that cannot be easily removed. It bleaches the hair thus making it invisible without any risk of hair growth stimulation. This laser technology bleaches the fine hairs and treats any type of skin: white, dark and tanned. It targets the melanin in the hair shaft and bleaches it, thus making it invisible.

I have been informed of the following details of the treatment:

- The procedure bleach disguises dark hairs, transforming them into a blonde or golden color making the hairs harder to see.
- This can be useful on an area that has thin but dark hairs like the face or neck. This is a unique solution for unwanted baby hair.
- All body areas can undergo the laser bleaching treatments safely and effectively except the eye area.
- Laser hair bleaching can be done once every 4 - 6 weeks and when desired.
- It is well-known that the fine hair (also known as baby hair) cannot be removed permanently by laser hair removal and sometimes though rear the opposite occurs, this fine hair is transformed to thick coarse hair due to thermal effects of laser hair removal.
- For laser bleaching, the hair becomes almost invisible. After 10- 15 days they fall out and then re-grow after 4 - 6 weeks in the same texture and quality. No specific care is needed except for the use of sunscreen.

I hereby consent to and authorize VISION MEDICAL & DENTAL CENTER (Abu Dhabi) to perform Laser Hair bleaching on me. I understand I may experience slight tingling sensation during treatment and will require some precautions under the sun.
